

## OWL NOTIONS; OWL-DL vs. RDF/RDFS; MODEL vs. GRAPH

- OWL is defined based on (Description Logics) model theory,
- OWL ontologies can be represented by RDF graphs,
- **Only certain RDF graphs are allowed OWL-DL ontologies:** those, where class names, property names, individuals etc. occur in a well-organized way.
- Reasoning works on the (Description Logic) model, the RDF graph is only a means to represent it.  
(recall: RDF/RDFS “reasoning” works on the graph level)

291

## OWL VOCABULARIES

- An **OWL-DL vocabulary**  $\mathcal{V}$  is a 7-tuple (= a sorted vocabulary)  
 $\mathcal{V} = (\mathcal{V}_{cls}, \mathcal{V}_{objprop}, \mathcal{V}_{dtprop}, \mathcal{V}_{annprop}, \mathcal{V}_{indiv}, \mathcal{V}_{DT}, \mathcal{V}_{lit})$ :
- $\mathcal{V}_{cls}$  is the set of URIs denoting **class names**,  
`<http://.../mondial/10/meta#Country>`
- $\mathcal{V}_{objprop}$  is the set of URIs denoting **object property names**,  
`<http://.../mondial/10/meta#capital>`
- $\mathcal{V}_{dtprop}$  is the set of URIs denoting **datatype property names**,  
`<http://.../mondial/10/meta#population>`
- ( $\mathcal{V}_{annprop}$  is the set of URIs denoting **annotation property names**,)
- $\mathcal{V}_{indiv}$  is the set of URIs denoting **individuals**, `<http://.../mondial/10/countries/D>`
- $\mathcal{V}_{DT}$  is the set of URIs denoting **datatype names**,  
`<http://www.w3.org/2001/XMLSchema#int>`
- $\mathcal{V}_{lit}$  is the set of **literals**;
- the builtin notions (=URIs) from RDF, RDFS, OWL namespaces do not belong to the vocabulary of the ontology (they are only used for describing the ontology in RDF).

292

## OWL INTERPRETATIONS

Since DL is a subset of FOL, the interpretation of an OWL-DL vocabulary can be given as a FOL interpretation

$$\mathcal{I} = (I_{\text{indiv}} \cup I_{\text{cls}} \cup I_{\text{objprop}} \cup I_{\text{dtprop}} \cup I_{\text{annprop}} \cup I_{DT}, \mathcal{U}_{\text{obj}} \cup \mathcal{U}_{DT})$$

where  $I$  interprets the vocabulary as

- $I_{\text{indiv}}$  constant symbols (individuals),
- $I_{\text{cls}}, I_{DT}$  unary predicates (classes and datatypes),
- $I_{\text{objprop}}, I_{\text{dtprop}}, I_{\text{annprop}}$  binary predicates (properties),

and the universe  $\mathcal{U}$  is partitioned into

- an *object domain*  $\mathcal{U}_{\text{obj}}$
- and a *data domain*  $\mathcal{U}_{DT}$  (of all values of datatypes).

293

## OWL INTERPRETATIONS

The interpretation  $I$  is as follows:

- $I_{\text{indiv}}$ : each individual  $a \in \mathcal{V}_{\text{indiv}}$  to an object  $I(a) \in \mathcal{U}_{\text{obj}}$ ,  
(e.g.,  $I(\langle \text{http://.../mondial/10/countries/D} \rangle) = \text{germany}$ )
- $I_{\text{cls}}$ : each class  $C \in \mathcal{V}_{\text{cls}}$  to a set  $I(C) \subseteq \mathcal{U}_{\text{obj}}$ ,  
(e.g.,  $\text{germany} \in I(\langle \text{http://.../mondial/10/meta\#Country} \rangle)$ )
- $I_{DT}$ : each datatype  $D \in \mathcal{V}_{DT}$  to a set  $I(D) \subseteq \mathcal{U}_{DT}$ ,  
(e.g.,  $I(\langle \text{http://www.w3.org/2001/XMLSchema\#int} \rangle) = \{\dots, -2, -1, 0, 1, 2, \dots\}$ )
- $I_{\text{objprop}}$ : each object property  $p \in \mathcal{V}_{\text{objprop}}$  to a binary relation  $I(p) \subseteq \mathcal{U}_{\text{obj}} \times \mathcal{U}_{\text{obj}}$ ,  
(e.g.,  $(\text{germany}, \text{berlin}) \in I(\langle \text{http://.../mondial/10/meta\#capital} \rangle)$ )
- $I_{\text{dtprop}}$ : each datatype property  $p \in \mathcal{V}_{\text{dtprop}}$  to a binary relation  $I(p) \subseteq \mathcal{U}_{\text{obj}} \times \mathcal{U}_D$ ,  
(e.g.,  $(\text{germany}, 83536115) \in I(\langle \text{http://.../mondial/10/meta\#population} \rangle)$ )
- $I_{\text{annprop}}$ : each annotation property  $p \in \mathcal{V}_{\text{annprop}}$  to a binary relation  $I(p) \subseteq \mathcal{U} \times \mathcal{U}$ .

294

## OWL Class Definitions and Axioms (Overview)

- owl:Class
- The properties of an owl:Class (including owl:Restriction) node describe the properties of that class.

An owl:Class is required to satisfy the conjunction of all constraints (implicit: intersection) stated about it.

These characterizations are roughly the same as discussed for DL class definitions:

- Constructors: owl:unionOf, owl:intersectionOf, owl:complementOf ( $\mathcal{ALC}$ )
- Enumeration Constructor: owl:oneOf (enumeration of elements;  $\mathcal{O}$ )
- Axioms rdfs:subClassOf, owl:equivalentClass,
- Axiom owl:disjointWith (also expressible in  $\mathcal{ALC}$ :  $C$  disjoint with  $D$  is equivalent to  $C \sqsubseteq \neg D$ )

## OWL NOTIONS (CONT'D)

### OWL Restriction Classes (Overview)

- owl:Restriction is a subclass of owl:Class, allowing for specification of a **constraint on one property**.
- one property is restricted by an owl:onProperty specifier and a constraint on this property:
  - ( $\mathcal{N}, \mathcal{Q}, \mathcal{F}$ ) owl:cardinality, owl:minCardinality or owl:maxCardinality,
  - owl:allValuesFrom ( $\forall R.C$ ), owl:someValuesFrom ( $\exists R.C$ ),
  - owl:hasValue ( $\mathcal{O}$ ),
  - including datatype restrictions for the range ( $D$ )
- by defining intersections of owl:Restrictions, classes having multiple such constraints can be specified.

## OWL NOTIONS (CONT'D)

### OWL Property Axioms (Overview)

- Distinction between owl:ObjectProperty and owl:DatatypeProperty
- from RDFS: rdfs:domain/rdfs:range assertions, rdfs:subPropertyOf
- Axiom owl:equivalentProperty
- Axioms: subclasses of rdf:Property:  
 owl:TransitiveProperty, owl:SymmetricProperty, owl:FunctionalProperty,  
 owl:InverseFunctionalProperty (see Slide 311)

### OWL Individual Axioms (Overview)

- Individuals are modeled by unary classes
- owl:sameAs, owl:differentFrom, owl:AllDifferent( $o_1, \dots, o_n$ ).

297

## FIRST-ORDER LOGIC EQUIVALENTS

OWL : $x \in C$	DL Syntax	FOL
$C$	$C$	$C(x)$
intersectionOf( $C_1, C_2$ )	$C_1 \sqcap \dots \sqcap C_n$	$C_1(x) \wedge \dots \wedge C_n(x)$
unionOf( $C_1, C_2$ )	$C_1 \sqcup \dots \sqcup C_n$	$C_1(x) \vee \dots \vee C_n(x)$
complementOf( $C_1$ )	$\neg C_1$	$\neg C_1(x)$
oneOf( $x_1, \dots, x_n$ )	$\{x_1\} \sqcup \dots \sqcup \{x_n\}$	$x = x_1 \vee \dots \vee x = x_n$
OWL : $x \in C$ , Restriction on $P$	DL Syntax	FOL
someValuesFrom( $C'$ )	$\exists P.C'$	$\exists y : P(x, y) \wedge C'(y)$
allValuesFrom( $C'$ )	$\forall P.C'$	$\forall y : P(x, y) \rightarrow C'(y)$
hasValue( $y$ )	$\exists P.\{y\}$	$P(x, y)$
maxCardinality( $n$ )	$\leq n.P$	$\exists^{\leq n} y : P(x, y)$
minCardinality( $n$ )	$\geq n.P$	$\exists^{\geq n} y : P(x, y)$
cardinality( $n$ )	$n.P$	$\exists^=n y : P(x, y)$

298

## FIRST-ORDER LOGIC EQUIVALENTS (CONT'D)

OWL Class Axioms for $C$	DL Syntax	FOL
<code>rdfs:subClassOf(<math>C_1</math>)</code>	$C \sqsubseteq C_1$	$\forall x : C(x) \rightarrow C_1(x)$
<code>equivalentClass(<math>C_1</math>)</code>	$C \equiv C_1$	$\forall x : C(x) \leftrightarrow C_1(x)$
<code>disjointWith(<math>C_1</math>)</code>	$C \sqsubseteq \neg C_1$	$\forall x : C(x) \rightarrow \neg C_1(x)$

OWL Individual Axioms	DL Syntax	FOL
$x_1$ <code>sameAs</code> $x_2$	$\{x_1\} \equiv \{x_2\}$	$x_1 = x_2$
$x_1$ <code>differentFrom</code> $x_2$	$\{x_1\} \sqsubseteq \neg\{x_2\}$	$x_1 \neq x_2$
<code>AllDifferent(<math>x_1, \dots, x_n</math>)</code>	$\bigwedge_{i \neq j} \{x_i\} \sqsubseteq \neg\{x_j\}$	$\bigwedge_{i \neq j} x_i \neq x_j$

299

## FIRST-ORDER LOGIC EQUIVALENTS (CONT'D)

OWL Properties	DL Syntax	FOL
$P$	$P$	$P(x, y)$

OWL Property Axioms for $P$	DL Syntax	FOL
<code>rdfs:range(<math>C</math>)</code>	$\top \sqsubseteq \forall P.C$	$\forall x, y : P(x, y) \rightarrow C(y)$
<code>rdfs:domain(<math>C</math>)</code>	$C \sqsupseteq \exists P.\top$	$\forall x, y : P(x, y) \rightarrow C(x)$
<code>subPropertyOf(<math>P_2</math>)</code>	$P \sqsubseteq P_2$	$\forall x, y : P(x, y) \rightarrow P_2(x, y)$
<code>equivalentProperty(<math>P_2</math>)</code>	$P \equiv P_2$	$\forall x, y : P(x, y) \leftrightarrow P_2(x, y)$
<code>inverseOf(<math>P_2</math>)</code>	$P \equiv P_2^-$	$\forall x, y : P(x, y) \leftrightarrow P_2(y, x)$
<code>TransitiveProperty</code>	$P^+ \equiv P$	$\forall x, y, z : ((P(x, y) \wedge P(y, z)) \rightarrow P(x, z))$ $\forall x, z : ((\exists y : P(x, y) \wedge P(y, z)) \rightarrow P(x, z))$
<code>FunctionalProperty</code>	$\top \sqsubseteq \leq 1P.\top$	$\forall x, y_1, y_2 : P(x, y_1) \wedge P(x, y_2) \rightarrow y_1 = y_2$
<code>InverseFunctionalProperty</code>	$\top \sqsubseteq \leq 1P^-.\top$	$\forall x, y_1, y_2 : P(y_1, x) \wedge P(y_2, x) \rightarrow y_1 = y_2$

300

## SYNTACTICAL REPRESENTATION

- OWL specifications can be represented by graphs: OWL constructs have a straightforward representation as triples in RDF/XML and N3.
- there are several logic-based representations (e.g. *Manchester OWL Syntax*); TERP (which can be used with pellet) is a combination of Turtle and Manchester syntax.
- OWL in RDF/XML format: usage of class, property, and individual names:
  - as `@rdf:about` when used as identifier of a subject (`owl:Class`, `rdf:Property` and their subclasses),
  - as `@rdf:resource` as the object of a property.
- some constructs need auxiliary structures (collections):  
`owl:unionOf`, `owl:intersectionOf`, and `owl:oneOf` are based on Collections
  - representation in RDF/XML by `rdf:parseType="Collection"`.
  - representation in N3 by  $(x_1 \ x_2 \ \dots \ x_n)$
  - as RDF lists: `rdf:List`, `rdf:first`, `rdf:rest`

301

## REQUIREMENT

- every entity in an OWL ontology must be explicitly typed (i.e., as a class, an object property, a datatype property, . . . , or an instance of some class).  
(for reasons of space this is not always done in the examples; in general, it may lead to incomplete results)

302

## QUERYING OWL DATA

- queries are atomic and conjunctive DL queries against the underlying OWL-DL model.
- this model can still be seen as a graph:
  - many of the edges are those known from the basic RDF graph
  - some edges (and collections) are only there for encoding OWL stuff (describing owl:unionOf, owl:propertyChain etc.) – these should not be queried
- SPARQL-DL is a subset of SPARQL: not every SPARQL query pattern is allowed for use on an OWL ontology (but the reasonable ones are, so in practice this is not a problem.)
- the query language SPARQL-DL allows exactly such well-sorted patterns using the notions of OWL.

303

## SOME TBOX-ONLY REASONING EXAMPLES ON SETS

### EXAMPLE: PARADOX

```
<?xml version="1.0"?>
<rdf:RDF xmlns:owl="http://www.w3.org/2002/07/owl#"
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xml:base="foo://bla/">
<owl:Class rdf:about="Paradox">
  <owl:complementOf rdf:resource="Paradox"/>
</owl:Class>
</rdf:RDF>
```

[Filename: RDF/paradox.rdf]

- without reasoner:  
jena -t -if paradox.rdf  
Outputs the same RDF facts in N3 without checking consistency.
- with reasoner:  
jena -e -pellet -if paradox.rdf  
reads the RDF file, creates a model (and checks consistency) and in this case reports that it is not consistent.

304

## UNION AS $A \sqcup B \equiv \neg((\neg A) \sqcap (\neg B))$

```
@prefix : <foo://bla/>.
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
:A rdf:type owl:Class.      :B rdf:type owl:Class.
:Union1 owl:unionOf (:A :B).
:CompA owl:complementOf :A.  :CompB owl:complementOf :B.
:IntersectComps owl:intersectionOf (:CompA :CompB).
:Union2 owl:complementOf :IntersectComps.
:x rdf:type :A.              :x rdf:type :B.
:y rdf:type :CompA. # a negative assertion y not in A would be better -> OWL 2
:y rdf:type :CompB. [Filename: RDF/union.n3]
```

```
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
prefix : <foo://bla/>
select ?X ?C ?D
from <file:union.n3> [Filename: RDF/union.sparql]
where {{?X rdf:type ?C} UNION {:Union1 owl:equivalentClass ?D}}
```

305

## EXAMPLE: UNION AND SUBCLASS

```
<?xml version="1.0"?>
<rdf:RDF xmlns:owl="http://www.w3.org/2002/07/owl#"
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:f="foo://bla/"
  xml:base="foo://bla/">
  <owl:Class rdf:about="Person">
    <owl:unionOf rdf:parseType="Collection">
      <owl:Class rdf:about="Male"/>
      <owl:Class rdf:about="Female"/>
    </owl:unionOf>
  </owl:Class>
  <owl:Class rdf:about="EqToPerson">
    <owl:unionOf rdf:parseType="Collection">
      <owl:Class rdf:about="Female"/>
      <owl:Class rdf:about="Male"/>
    </owl:unionOf>
  </owl:Class>
  <f:Person rdf:about="unknownPerson"/>
</rdf:RDF> [Filename: RDF/union-subclass.rdf]
```

306

## Example (Cont'd)

- print class tree (with jena -e -pellet):

```
owl:Thing
  bla:Person = bla:EqToPerson - (bla:unknownPerson)
    bla:Female
    bla:Male
```

- Male and Female are derived to be subclasses of Person.
- Person and EqToPerson are equivalent classes.
- unknownPerson is a member of Person and EqToPerson.

```
prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <foo://bla/>
select ?SC ?C ?T ?CC ?CD
from <file:union-subclass.rdf>
where {{?SC rdfs:subClassOf ?C} UNION
      {?unknownPerson rdf:type ?T} UNION
      {?CC owl:equivalentClass ?CD}}
```

 [Filename: RDF/union-subclass.sparql]

307

## EXERCISE

Consider

```
<owl:Class rdf:about="C1">
  <owl:intersectionOf rdf:parseType="Collection">
    <owl:Class rdf:about="A"/>
    <owl:Class rdf:about="B"/>
  </owl:intersectionOf>
</owl:Class>
```

and

```
<owl:Class rdf:about="C2">
  <rdfs:subClassOf rdf:resource="A"/>
  <rdfs:subClassOf rdf:resource="B"/>
</owl:Class>
```

- give mathematical characterizations of both cases.
- discuss whether both fragments are equivalent or not.

308

## DISCUSSION

- Two classes are *equivalent* (wrt. the knowledge base) if they have the same interpretation in every *model* of the KB.
- $C_1$  is characterized to be the intersection of classes  $A$  and  $B$ .
- for  $C_2$ , it is asserted that  $C_2$  is a subset of  $A$  and that it is a subset of  $B$ .
- Thus there can be some  $c$  that is in  $A, B, C_1$ , but not in  $C_2$ .
- Thus,  $C_1$  and  $C_2$  are not equivalent.

309

## DISCUSSION: FORMAL NOTATION

The DL equivalent to the knowledge base (TBox) is

$$\mathcal{T} = \{C_1 \equiv (A \sqcap B), \quad C_2 \sqsubseteq A, \quad C_2 \sqsubseteq B\}$$

The First-Order Logic equivalent is

$$\mathcal{KB} = \{\forall x : A(x) \wedge B(x) \leftrightarrow C_1(x), \quad \forall x : C_2(x) \rightarrow A(x) \wedge B(x)\}$$

Thus,  $\mathcal{KB} \models \forall x : C_2(x) \rightarrow A(x) \wedge B(x)$ .

Or, in DL:  $\mathcal{T} \models C_2 \sqsubseteq C_1$ .

On the other hand,  $\mathcal{M} = (\mathcal{D}, \mathcal{I})$  with  $\mathcal{D} = \{c\}$  and

$$\mathcal{I}(A) = \{c\}, \quad \mathcal{I}(B) = \{c\}, \quad \mathcal{I}(C_1) = \{c\}, \quad \mathcal{I}(C_2) = \emptyset$$

is a model of  $\mathcal{KB}$  (wrt. first-order logic) and  $\mathcal{T}$  (wrt. DL) that shows that  $C_1$  and  $C_2$  are not equivalent.

310

## SUBCLASSES OF PROPERTIES

Triple syntax: *some property rdf:type a specific type of property*

### According to their ranges

- [owl:ObjectProperty](#) – subclass of `rdf:Property`; object-valued (i.e. `rdfs:range` must be an Object class)
- [owl:DatatypeProperty](#) – subclass of `rdf:Property`; datatype-valued (i.e. its `rdfs:range` must be an `rdfs:Datatype`)

⇒ OWL ontologies require each property to be typed in such a way!  
(for reasons of space sometimes omitted in examples)

### According to their Cardinality

- specifying n:1 or 1:n cardinality:  
[owl:FunctionalProperty](#), [owl:InverseFunctionalProperty](#)

⇒ useful for deriving that objects must be different from each other.

### According to their Properties

- [owl:TransitiveProperty](#), [owl:SymmetricProperty](#) see later ...

311

## FUNCTIONAL CARDINALITY SPECIFICATION

### *property* `rdf:type owl:FunctionalProperty`

- not a constraint, but
- if such a property results in two things ... these things are inferred to be the same.

```
@prefix : <foo://bla/names#>.
@prefix family: <foo://bla/persons/>.
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .
@prefix owl: <http://www.w3.org/2002/07/owl#>.
    :world :has_pope family:jorgebergoglio .
    :world :has_pope [ :name "Franziskus" ] .
    :has_pope rdf:type owl:FunctionalProperty.
```

[Filename: RDF/pop.es.n3]

```
prefix : <foo://bla/names#>
prefix family: <foo://bla/persons/>
select ?N from <file:pop.es.n3>
where { family:jorgebergoglio :name ?N }
```

[Filename: RDF/pop.es.sparql]

312

## OWL:RESTRICTION – EXAMPLE

- owl:Restriction for  $\exists p.C$  and  $\forall p.C$ . (cf. earlier examples)

```
<?xml version="1.0"?>
<rdf:RDF xmlns:owl="http://www.w3.org/2002/07/owl#"
  xmlns:rdf="http://www.w3.org/1999/02/22-rdf-syntax-ns#"
  xmlns:f="foo://bla/"
  xml:base="foo://bla/">
  <owl:Class rdf:about="Parent">
    <owl:intersectionOf rdf:parseType="Collection">
      <owl:Class rdf:about="Person"/>
      <owl:Restriction>
        <owl:onProperty rdf:resource="hasChild"/>
        <owl:minCardinality>1</owl:minCardinality>
      </owl:Restriction>
    </owl:intersectionOf>
  </owl:Class>
  <f:Person rdf:about="john">
    <f:hasChild><f:Person rdf:about="alice"/></f:hasChild>
  </f:Person>
</rdf:RDF>
```

```
prefix : <foo://bla/>
select ?C
from <file:restriction.rdf>
where { :john a ?C }
```

[Filename: RDF/restriction.sparql]

[Filename: RDF/restriction.rdf]

313

## RESTRICTIONS ONLY AS BLANK NODES

Consider the following (bad) specification:

```
:badIdea a owl:Restriction; owl:onProperty :hasChild; owl:minCardinality 1.
```

This is not allowed in OWL-DL.

Correct specification:

```
:badIdea owl:equivalentClass
  [a owl:Restriction; owl:onProperty :hasChild; owl:minCardinality 1].
```

Why? ... there are many reasons, for one of them see next slide.

314

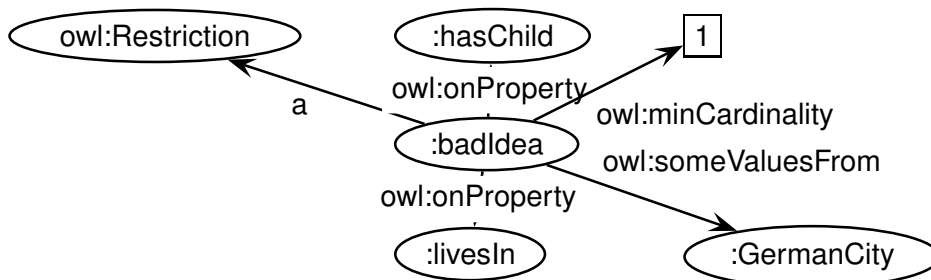

## Restrictions Only as Blank Nodes (Cont'd)

A class with two such specifications:

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo://bla/>.
:badIdea a owl:Restriction; owl:onProperty :hasChild; owl:minCardinality 1 .
:badIdea a owl:Restriction; owl:onProperty :livesIn; owl:someValuesFrom :GermanCity.
```

[Filename: RDF/badIdea.n3]

- call `jena -t -pellet -if badIdea.n3`:

The two restriction specifications are messed up.

315

## Restrictions Only as Blank Nodes (Cont'd)

- Thus specify each Restriction specification with a separate blank node:

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo://bla/>.
:TwoRestrictions owl:equivalentClass
[ owl:intersectionOf
  ( [ a owl:Restriction; owl:onProperty :hasChild; owl:minCardinality 1 ]
    [ a owl:Restriction; owl:onProperty :livesIn; owl:someValuesFrom :GermanCity ] ) ].
```

[Filename: RDF/twoRestrictions.n3]

The DL equivalent:  $\text{TwoRestrictions} \equiv (\exists \text{hasChild}.\top) \sqcap (\exists \text{livesIn}.\text{GermanCity})$

## Another reason:

```
:AnotherBadDesignExample a owl:Restriction;
  owl:onProperty :hasChild; owl:minCardinality 1;
  rdfs:subClassOf :Person.
```

... mixes the *definition* of the Restriction with an assertive axiom:  $\text{ABDE} \equiv \exists \geq 1 \text{hasChild}.\top \wedge \text{ABDE} \sqsubseteq \text{Person}$

316

## MULTIPLE RESTRICTIONS ON A PROPERTY

- “All persons that have at least two children, and one of them is male”

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix : <foo://bla/>.
### Test: multiple restrictions: the someValuesFrom-condition is then ignored
:HasTwoChildrenOneMale owl:intersectionOf (:Person
  [ a owl:Restriction; owl:onProperty :hasChild;
    owl:someValuesFrom :Male; owl:minCardinality 2 ] ).
:name a owl:FunctionalProperty.
:Male rdfs:subClassOf :Person; owl:disjointWith :Female.
:Female rdfs:subClassOf :Person.
:kate a :Female; :name "Kate"; :hasChild :john.
:john a :Male; :name "John";
  :hasChild [a :Female; :name "Alice"], [a :Male; :name "Bob"].
:sue a :Female; :name "Sue";
  :hasChild [a :Female; :name "Anne"], [a :Female; :name "Barbara"].
```

```
prefix : <foo://bla/>
select ?X
from <file:restriction-double.n3>
where {?X a :HasTwoChildrenOneMale}
```

[Filename: RDF/restriction-double.sparql]

[Filename: RDF/restriction-double.n3]

- The the someValuesFrom-condition is ignored in this case (Result: John and Sue).
- Solution: intersection of restrictions

317

## MULTIPLE RESTRICTIONS ON A PROPERTY

- “All persons that have at least two children, and one of them is male”

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix : <foo://bla/>.
:HasTwoChildrenOneMale owl:equivalentClass
  [ owl:intersectionOf (:Person
    [ a owl:Restriction; owl:onProperty :hasChild; owl:someValuesFrom :Male]
    [ a owl:Restriction; owl:onProperty :hasChild; owl:minCardinality 2 ] ) ].
:name a owl:FunctionalProperty.
:Male rdfs:subClassOf :Person; owl:disjointWith :Female.
:Female rdfs:subClassOf :Person.
:kate a :Female; :name "Kate"; :hasChild :john.
:john a :Male; :name "John";
  :hasChild [a :Female; :name "Alice"], [a :Male; :name "Bob"].
:sue a :Female; :name "Sue";
  :hasChild [a :Female; :name "Anne"], [a :Female; :name "Barbara"].
```

```
prefix : <foo://bla/>
select ?X
from <file:intersect-restrictions.n3>
where {?X a :HasTwoChildrenOneMale}
```

[Filename: RDF/intersect-restrictions.sparql]

[Filename: RDF/intersect-restrictions.n3]

- Note: this is different from Qualified Range Restrictions such as “All persons that have at least two male children” – see Slide 376.

318

## USE OF A DERIVED CLASS

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix : <foo://bla/names#>.
:kate :name "Kate"; :child :john.
:john :name "John"; :child :alice.
:alice :name "Alice".
:Parent a owl:Class; owl:equivalentClass
  [ a owl:Restriction; owl:onProperty :child; owl:minCardinality 1].
:Grandparent owl:equivalentClass
  [a owl:Restriction; owl:onProperty :child; owl:someValuesFrom :Parent].
```

[Filename: RDF/grandparent.n3]

```
prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
prefix : <foo://bla/names#>
select ?A ?B
from <file:grandparent.n3>
where {{?A a :Parent} UNION
       {?B a :Grandparent} UNION
       {:Grandparent rdfs:subClassOf :Parent}}
```

[Filename: RDF/grandparent.sparql]

319

## NON-EXISTENCE OF PROPERTY FILLERS

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo://bla/names#>.
:kate a :Person; :name "Kate"; :hasChild :john.
:john a :Person; :name "John"; :hasChild :alice, :bob.
:alice a :Person; :name "Alice".
:bob a :Person; :name "Bob".
:name a owl:FunctionalProperty.
:ChildlessA owl:intersectionOf (:Person
  [ a owl:Restriction; owl:onProperty :hasChild; owl:maxCardinality 0]).
:ChildlessB owl:intersectionOf (:Person
  [ a owl:Restriction; owl:onProperty :hasChild; owl:allValuesFrom owl:Nothing]).
:ParentA owl:intersectionOf (:Person [owl:complementOf :ChildlessA]).
:ParentB owl:intersectionOf (:Person
  [ a owl:Restriction; owl:onProperty :hasChild; owl:minCardinality 1]).
```

```
prefix : <foo://bla/names#>
select ?X ?Y
from <file:childless.n3>
where {{?X a :ChildlessA}
       union {?Y a :ParentA}}
```

[Filename: RDF/childless.sparql]

[Filename: RDF/childless.n3]

- export class tree: ChildlessA and ChildlessB are equivalent,
- note: due to the Open World Assumption, both classes are empty.
- Persons where no children are known are neither in ChildlessA or in Parent!

320

## INVERSE PROPERTIES

- *owl:ObjectProperty owl:inverseOf owl:ObjectProperty*
- *owl:DatatypeProperties* cannot have an inverse  
(this would define properties of objects, cf. next slide)

```
@prefix : <foo://bla/names#> .
@prefix family: <foo://bla/persons/> .
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#> .
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
  family:john :child family:alice, family:bob.
  family:john :parent family:kate .
  :descendant rdf:type owl:TransitiveProperty.
  :child rdfs:subPropertyOf :descendant.
  :child owl:inverseOf :parent.
```

```
prefix : <foo://bla/names#>
select ?X ?Y
from <file:inverse.n3>
where {?X :descendant ?Y}
```

[Filename: RDF/inverse.n3]

[Filename: RDF/inverse.sparql]

321

### No Inverses of *owl:DatatypeProperties*!

- an *owl:DatatypeProperty* must not have an inverse:
- “:john :age 35” would imply “35 :ageOf :john” which would mean that a literal has a property, which is not allowed.

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>.
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#> .
@prefix : <foo://bla/names#> .
# :john :name "John"; :age 35; :child [:name "Alice"], [:name "Bob"; :age 8].
:age a owl:DatatypeProperty.
:child a rdf:Property.
:childOf owl:inverseOf :child.
:ageOf owl:inverseOf :age.
```

[Filename: RDF/inverseDTProp.n3]

```
jena -e -pellet -if inverseDTProp.n3
```

```
WARN [main] (OWLLoader.java:352) - Unsupported axiom:
```

```
Ignoring inverseOf axiom between foo://bla/names#ageOf (ObjectProperty)
and foo://bla/names#age (DatatypeProperty)
```

322

## SPECIFICATION OF INVERSE FUNCTIONAL PROPERTIES

- Mathematics: a mapping  $m$  is inverse-functional if the inverse of  $m$  is functional:  
 $x p y$  is inverse-functional, if for every  $y$ , there is at most one  $x$  such that  $xpy$  holds.
- Example:
  - hasCarCode is functional: every country has one car code,
  - hasCarCode is also inverse functional: every car code uniquely identifies a country.
- OWL:  
:m-inverse owl:inverseOf :m .  
:m-inverse a owl:FunctionalProperty .  
not allowed for e.g. mon:carCode a owl:DatatypeProperty:

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo:bla#>.
:carCode a owl:DatatypeProperty; rdfs:domain :Country;
  owl:inverseOf :isCarCodeOf.
# :Germany :carCode "D".
```

[Filename: RDF/noinverse.n3]

- the statement is rejected.

323

## OWL:INVERSEFUNCTIONALPROPERTY

- such cases are described with owl:InverseFunctionalProperty
- a property  $P$  is an owl:InverseFunctionalProperty if  
 $\forall x, y_1, y_2 : P(y_1, x) \wedge P(y_2, x) \rightarrow y_1 = y_2$  holds

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo:bla#>.
:carCode rdfs:domain :Country; a owl:DatatypeProperty;
  a owl:FunctionalProperty; a owl:InverseFunctionalProperty.
:name a owl:DatatypeProperty; a owl:FunctionalProperty.
:Germany :carCode "D"; :name "Germany".
:DominicanRepublic :carCode "D"; :name "Dominican Republic".
```

[Filename: RDF/invfunctional.n3]

- the fragment is detected to be inconsistent.

324

## OWL:hasKey (OWL 2)

Declaration of key attributes  $(k_1, \dots, k_n)$  is a relevant issue in data modeling.

- a key allows for unambiguously identifying a resource amongst a certain subset of the domain,
- keys are not restricted to functional properties (i.e., SQL's UNIQUE is not required),
- values of key properties may be unknown for some instances; they might even be forbidden for some elements of the domain (e.g. using owl:maxCardinality 0 or owl:allValuesFrom owl:Nothing).
- note: InverseFunctionalProperty covers the simple case that  $n = 1$  and the key is global.

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo:bla#>.
:name a owl:DatatypeProperty; a owl:FunctionalProperty.
:Country owl:hasKey (:carCode).
:Germany a :Country; :carCode "D"; :name "Germany".
:DominicanRepublic a :Country; :carCode "D"; :name "Dominican Republic".
```

[Filename: RDF/haskey.n3]

325

- the fragment is inconsistent.

326

## OWL:hasKey (OWL 2)

- keys can also be used to detect that two resources (e.g. described by different Web sources) are actually the same:

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo:bla#>.
:Person owl:hasKey (:givenName :familyName).
_:b1 a :Person; :firstName "John"; :familyName "Doe"; :age 32 .
_:b2 a :Person; :firstName "John"; :familyName "Doe"; :address "Main Street 1" .
```

[Filename: RDF/haskey2.n3]

```
prefix : <foo:bla#>
select ?X ?P ?Y
from <file:haskey2.n3>
where {?X a :Person ; ?P ?Y}
```

[Filename: RDF/haskey2.sparql]

327

## OWL:hasKey (OWL 2)

- keys are not restricted to functional properties:

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo:bla#>.
:District owl:hasKey (:code).
:Country owl:hasKey (:code).
:goettingen a :District; :name "Goettingen"; :code "GOE", "DUD", "HMÄIJ".
:leipzig a :District; :name "Leipzig"; :code "L".
:lahndillkreis a :District; :name "Lahn-Dill-Kreis"; :code "LDK", "DIL", "WZ", "L".
:luxembourg a :Country; :name "Luxembourg"; :code "L".
```

[Filename: RDF/key-mvd.n3]

```
prefix : <foo:bla#>
select ?D ?N ?C
from <file:key-mvd.n3>
where { ?X a ?D ; :name ?N ; :code ?C }
```

[Filename: RDF/key-mvd.sparql]

- Lahn-Dill-Kreis and Leipzig are identified (LDK had “L” from 1977-1990).
- Luxembourg is not identified with them since the key definitions are local to districts vs. countries.

328

## NAMED AND UNNAMED RESOURCES

(from the DL reasoner's perspective)

### Named Resources

- resources with explicit global URIs  
<<http://www.semwebtech.org/mondial/10/country/D>>  
<<foo://bla/bob>>
- resources with local IDs/named blank nodes
- unnamed blank nodes

### Unnamed (implicit) Resources

- things that exist only implicitly:  
John's child in  

```
:Parent a owl:Class; owl:equivalentClass  
    [a owl:Restriction; owl:onProperty :child; owl:minCardinality 1].  
:john a Parent.
```
- such resources can even have properties (see next slides).

329

### Implicit Resources

- “every person has a father who is a person” and “john is a person”.
  - the *standard model is infinite*:  
john, john's father, john's father's father, ...
  - pure RDF graphs are always finite,
  - only with OWL axioms, one can specify such infinite models,
- ⇒ they have only finitely many *locally to path length  $n$*  different nodes,
- the reasoner can detect the necessary  $n$  (“blocking”, cf. Slides 426 ff) and create “typical” different structures.

### Aside: “standard model” vs “nonstandard model”

- the term “standard model” is not only “what we understand (in this case)”, but is a notion of mathematical theory which –roughly– means “the simplest model of a specification”
- nonstandard models of the above are those where there is a cycle in the ancestors relation.  
(as the length of the cycle is arbitrary, this would not make it easier for the reasoner - there is only the possibility to have an owl:sameAs somewhere)

330

## Implicit Resources

```
@prefix : <foo://bla/names#>.
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
:Person owl:equivalentClass [a owl:Restriction;
  owl:onProperty :father; owl:someValuesFrom :Person].
:bob :name "Bob"; a :Person; :father :john.
:john :name "John"; a :Person.
```

[Filename: RDF/fathers-and-forefathers.n3]

```
prefix : <foo://bla/names#>
prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
select ?X ?F ?C
from <file:fathers-and-forefathers.n3>
where {{ ?X :father ?F } UNION { ?C a :Person }}
```

[Filename: RDF/fathers-and-forefathers.sparql]

- Reasoner: works on the model, including blocking, i.e. *modulo equivalence up to paths of length  $n$* .
- SPARQL (and SWRL) rules: works on the graph – without the unnamed/implicit resources.

331

## 7.3 RDF Graph vs. OWL Model; SPARQL vs. Reasoning

- SPARQL is an RDF (graph) query language
- OWL talks about models.

### Consequences (Overview)

⇒ SPARQL queries are answered against the graph of triples

- Some OWL notions are directly represented by triples, such as  $c$  a owl:Class.
- Some others are directly supported by special handling in the reasoners, e.g.,  $c$  rdfs:subClassOf  $d$  and  $c$  owl:equivalentClass  $d$ .
- some others are only “answered” when given explicitly in the RDF input! The results then do not incorporate further results that could be found by reasoning!
- OWL notions in the input are often not contained as triples, but are only translated into DL atoms for the reasoner. (e.g. owl:Restriction definitions)
- Most OWL notions in queries are not “understood” as OWL, but only matched.
- SPARQL answers are only concerned with the graph, not with implicit things that are only known in the model.

332

## NOT REASONED: OWL:FUNCTIONALPROPERTY

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo:bla#>.
:p a owl:ObjectProperty; rdfs:domain :D.
:D owl:equivalentClass [ a owl:Restriction; owl:onProperty :p;
                           owl:maxCardinality 1 ].
# :x :p :a, :b.      :a owl:differentFrom :b.
```

[Filename:RDF/functional.n3]

```
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <foo:bla#>
select ?P
from <file:functional.n3>
where {{ ?X :p ?Y } UNION {?P a owl:FunctionalProperty }}
```

[Filename:RDF/functional.sparql]

- SPARQL-DL (Sirin, Parsia OWLED 2007) is a proposal that allows certain OWL built-ins to be queried.

333

## NOT ALLOWED: COMPLEX TERMS IN SPARQL QUERIES

- example: all cities that are a capital
- runs both with pellet and jena (Feb. 2013):

```
pellet query -query-file countrycaps.sparql \
mondial-europe.n3 mondial-meta.n3 countrycaps.n3
```

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <http://www.semwebtech.org/mondial/10/meta#> .
:CountryCapital owl:intersectionOf
  (:City [a owl:Restriction; owl:onProperty :isCapitalOf;
         owl:someValuesFrom :Country]).      [Filename: RDF/countrycaps.n3]
```

```
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <http://www.semwebtech.org/mondial/10/meta#>
select ?N1 ?N2
where {{?X a :CountryCapital; :name ?N1} union
       {?Y a [a owl:Restriction; owl:onProperty :isCapitalOf;
             owl:someValuesFrom :Country]; :name ?N2}}
```

 [Filename:RDF/countrycaps.sparql]

- 53 answers, column ?N1 is filled, ?N2 is null.

334

## NOT ALLOWED: COMPLEX TERMS IN SPARQL QUERIES (CONT'D)

- all organizations whose headquarter city is a capital:
- **use pellet! jena does not support this (Feb. 2013):**

```
pellet query -query-file organizations-query2.sparql \  
mondial-europe.n3 mondial-meta.n3
```

```
prefix owl: <http://www.w3.org/2002/07/owl#>  
prefix : <http://www.semwebtech.org/mondial/10/meta#>  
select ?A ?H  
where {?X a [ owl:intersectionOf  
            (:Organization [a owl:Restriction; owl:onProperty :hasHeadq;  
                            owl:someValuesFrom  
                            [ a owl:Restriction; owl:onProperty :isCapitalOf;  
                              owl:someValuesFrom :Country ] ] ) ];  
          :abbrev ?A; :hasHeadq ?C . ?C :name ?H . }
```

[Filename:RDF/organizations-query2.sparql]

- 35 answers.

335

## HOW TO DO IT: SETS OF ANSWERS TO QUERIES AS AD-HOC CONCEPTS

- The result concept (and maybe others) must be added to the ontology.
- Example: all organizations whose headquarter city is a capital:

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.  
@prefix : <http://www.semwebtech.org/mondial/10/meta#> .  
:CountryCapital owl:equivalentClass  
  [ owl:intersectionOf  
    (:City [a owl:Restriction; owl:onProperty :isCapitalOf;  
           owl:someValuesFrom :Country])].  
<bla:Result> owl:equivalentClass [ owl:intersectionOf  
  (:Organization [a owl:Restriction; owl:onProperty :hasHeadq;  
                  owl:someValuesFrom :CountryCapital])]. [Filename: RDF/organizations-query.n3]
```

```
prefix : <http://www.semwebtech.org/mondial/10/meta#>  
select ?A ?N  
from <file:organizations-query.n3>  
from <file:mondial-europe.n3>  
from <file:mondial-meta.n3> [Filename:RDF/organizations-query.sparql]  
where {?X a <bla:Result> . ?X :abbrev ?A . ?X :hasHeadq ?C . ?C :name ?N}
```

336

## SPARQL ON THE GRAPH: IMPLICITLY KNOWN RESOURCES

- SPARQL does not return any answer related with nodes (=resources) that are only implicitly known (=non-named resources)

```
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo://bla/names#>.
:ParentOf12Y0Child owl:equivalentClass [a owl:Restriction;
  owl:onProperty :child; owl:someValuesFrom :12Y0Person].
:12Y0Person owl:equivalentClass [a owl:Restriction;
  owl:onProperty :age; owl:hasValue 12].
[ :name "John"; :age 35; a :ParentOf12Y0Child;
  :child [:name "Alice"; :age 10], [:name "Bob"; :age 8]].
:age rdf:type owl:FunctionalProperty.
# :12Y0Person owl:equivalentClass owl:Nothing.

:TwoChildrenParent owl:equivalentClass [a owl:Restriction;
  owl:onProperty :child; owl:cardinality 2].
:ThreeChildrenParent owl:equivalentClass [a owl:Restriction;
  owl:onProperty :child; owl:minCardinality 3]. [Filename: RDF/john-three-children-impl.n3]
```

337

### SPARQL and Non-Named Resources (Cont'd)

- implicit resources exist only on the reasoning level,
- not considered by SPARQL queries:

```
prefix : <foo://bla/names#>
prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
select ?X ?C ?A ?T
from <file:john-three-children-impl.n3>
where {{ ?X :name "John" . ?X a ?C }
  UNION {?X :age ?A} UNION {?T a :12Y0Person}}
```

[Filename: RDF/john-three-children-impl.sparql]

- John is a ThreeChildrenParent,
- no person known who is 12 years old
- adding :12Y0Person owl:equivalentClass owl:Nothing makes it inconsistent.
- implicitly known things are also not considered for the OWL construct owl:hasKey (cf. Slides 325 and 339) and for SWRL rules (cf. Slides 429 ff).

338

## [ASIDE/EXAMPLE] OWL:HASKEY AND NON-NAMED RESOURCES

Show that owl:hasKey ignores resources that are only implicitly known (OWL ontology see next slide):

- create an (infinite) sequence of implicitly known fathers ... all being persons and having the name "Adam",
- guarantee that the sequence consists of different objects by making it irreflexive. (note: Transitivity and Irreflexivity are not allowed together, thus actually only every person is required to be different from his/her father – the grandfather might be the person again)

339

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix : <foo:bla#>.
:Person owl:hasKey (:name) .
:name a owl:DatatypeProperty .
# :name a owl:InverseFunctionalProperty . ## that would do it instead of hasKey
:father a owl:FunctionalProperty, owl:IrreflexiveProperty; rdfs:range :Person.
:bob a :Person; :father :john .
:john :name "John" .
:Adam owl:equivalentClass [ a owl:Restriction; owl:onProperty :name; owl:hasValue "Adam" ] .
:Person rdfs:subClassOf
  [ a owl:Restriction; owl:onProperty :father; owl:someValuesFrom :Adam ].
:JohnAdam owl:equivalentClass [ owl:intersectionOf ( :Adam
  [ a owl:Restriction; owl:onProperty :name; owl:hasValue "John" ] ) ].
:hasFatherJohnAdam owl:equivalentClass [ a owl:Restriction;
  owl:onProperty :father; owl:someValuesFrom :JohnAdam ] .
:hasGrandpaAdam owl:equivalentClass [ a owl:Restriction; owl:onProperty :father;
  owl:someValuesFrom [ a owl:Restriction; owl:onProperty :father;
  owl:someValuesFrom :Adam ] ].
:AdamFatherAdam owl:equivalentClass [ owl:intersectionOf (:Adam
  [ a owl:Restriction; owl:onProperty :father; owl:someValueOf :Adam ] ) ] .
```

[Filename: RDF/forefathers-keys.n3]

340

## [ASIDE/EXAMPLE] OWL:HASKEY AND NON-NAMED RESOURCES

```
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <foo:bla#>
SELECT ?N ?A ?FA ?AFA ?GPA
FROM <forefathers-keys.n3>
WHERE {{ :bob :father [ :name ?N ] }
        # UNION { ?A :name "Adam" } ## error/bug complains about anon(1)
        UNION { ?FA a :hasFatherJohnAdam }
        UNION { ?AFA a :AdamFatherAdam }
        UNION { ?GPA a :hasGrandpaAdam }}}
```

[Filename: RDF/forefathers-keys.sparql]

- implicit nodes are not considered in the answers.
- owl:hasKey is not violated by the fact that several only implicitly known people are named "Adam".  
Note that John, being Bob's father, also gets the name "Adam".

341

## [ASIDE/EXAMPLE] OWL:HASKEY AND NON-NAMED RESOURCES

Another example using multi-attribute keys (which could not be replaced by owl:InverseFunctionalProperty):

- nodes in a (x,y)-coordinate system; consider (10,10)
- insert a pointer to an implicit node (10,10).

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix : <foo:bla#>.
:XYThing owl:hasKey (:x :y).
:xy10 a :XYThing; :x 10; :y 10; :text "free".
:XYTen owl:intersectionOf ([ a owl:Restriction; owl:onProperty :x; owl:hasValue 10
                             [ a owl:Restriction; owl:onProperty :y; owl:hasValue 10
                               [ a owl:Restriction; owl:onProperty :text; owl:hasValue "pointedTo"]]).
:pointTo a owl:FunctionalProperty; rdfs:range :XYThing.
:foo a [ a owl:Restriction;
        owl:onProperty :pointTo; owl:onClass :XYTen; owl:qualifiedCardinality 1].
# :foo :pointTo :xyxy. ## functionality of pointTo: makes :xyxy=(10,10) explicit
```

[Filename: RDF/easykeys-impl.n3]

342

## Aside/Example owl:hasKey and Non-Named Resources (Cont'd)

```
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <foo:bla#>
SELECT ?CT ?Y ?T ?SameAsxyxy
FROM <easykeys-impl.n3>
WHERE {{ :foo :pointTo [ :text ?CT ] }
        UNION { ?Y :text ?T }
        UNION { [:text ?T] }
        UNION { :xyxy owl:sameAs ?SameAsxyxy }}
```

[Filename: RDF/easykeys-impl.sparql]

Implicit nodes are not considered in the answers.

- with last in line in source commented out: not much – the “pointTo” text is not answered, nothing is :sameAs.
- with last line commented in: the implicit node which is pointed to is equated with :xyxy, made explicit and then equated also with :xy10.

343

## [ASIDE] OWL vs. RDF LISTS

- RDF provides structures for representing lists by triples (cf. Slide 226): [rdf:List](#), [rdf:first](#), [rdf:rest](#).  
These are *distinguished* classes/properties.
- OWL/reasoners have a still unclear relationship with these:
  - use of lists for its internal representation of owl:unionOf, owl:oneOf etc. (that are actually based on collections),
  - do or do not allow the user to query this internal representation,
  - ignore user-defined lists over usual resources.

344

## [ASIDE] UNIONOF (ETC) AS TRIPLES: LISTS

- owl:unionOf (x y z), owl:oneOf (x y z) is actually only syntactic sugar for RDF lists.
- The following are equivalent:

```
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix : <foo://bla/>.

:Male a owl:Class.
:Female a owl:Class.

:Person a owl:Class; owl:unionOf (:Male :Female).
:EqToPerson a owl:Class;
  owl:unionOf
  [ a rdf:List; rdf:first :Male;
    rdf:rest [ a rdf:List; rdf:first :Female; rdf:rest rdf:nil]].
:x a :Person. [Filename: RDF/union-list.n3]
```

- jena -t -if union-list.n3: both in usual N3 notation as owl:unionOf (:Male :Female).

345

## [ASIDE] UNIONOF (ETC) AS TRIPLES (CONT'D)

```
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <foo://bla/>
select ?C
from <file:union-list.n3>
where { :Person owl:equivalentClass ?C }
```

[Filename: RDF/union-list.sparql]

- jena -q -pellet -qf union-list.sparql: both are equivalent.

```
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <foo://bla/>
select ?P1 ?P2 ?X ?Q ?R ?S ?T
from <file:union-list.n3>
where { { :Person owl:equivalentClass :EqToPerson } UNION
  { :Person ?P1 ?X . ?X ?Q ?R . OPTIONAL { ?R ?S ?T } } UNION
  { :EqToPerson ?P2 ?X . ?X ?Q ?R } . OPTIONAL { ?R ?S ?T } } [Filename: RDF/union-list2.sparql]
```

- both have actually the same list structure  
(pellet2/nov 2008: fails; pellet 2.3/sept 2009: fails)

346

## [ASIDE] REASONING OVER LISTS (PITFALLS!)

- `rdf:first` and `rdf:rest` are (partially) ignored for reasoning (at least by pellet?); they cannot be used for deriving other properties from it.
- they can even not be used in queries (since pellet2/nov 2008; before it just showed weird behavior)

```
prefix rdf:
<http://www.w3.org/1999/02/22-rdf-syntax-ns#>
prefix owl: <http://www.w3.org/2002/07/owl#>
prefix : <foo://bla/>
select ?X ?Y ?Z
from <file:union-list.n3>
where {?X a rdf:List; rdf:first ?Y .
       OPTIONAL {?X rdf:rest ?Z}}
```

[Filename: RDF/union-list3.sparql]

- jena-tool with pellet2.3: OK.
- pellet2.3: NullPointerException.

347

## [Aside] Extension of a class defined by a list

Given an RDF list as below, define an owl:Class `:Invited` which contains exactly the elements in the list (i.e., in the above sample data, `:alice`, `:bob`, `:carol`, `:dave`).

```
@prefix : <foo:bla#>.
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>.
# Problem: when the real rdf namespace is used, rdf:first/rest are ignored
@prefix rdfL: <http://www.w3.org/1999/02/22-rdf-syntax-nsL#>. # <<<<<<<<<<<<<<<<<<<<
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.

:Invited a owl:Class.
:InvitationList rdfs:subClassOf rdfL:List.
:list1 a :InvitationList; rdfL:first :alice;
      rdfL:rest [a rdfL:List; rdfL:first :bob;
               rdfL:rest [a rdfL:List; rdfL:first :carol;
                       rdfL:rest [a rdfL:List; rdfL:first :dave; rdfL:rest rdf:nil]]].

# rest of an InvitationList is also an InvitationList
:InvitationList owl:equivalentClass
  [a owl:Restriction;
   owl:onProperty rdfL:rest; owl:allValuesFrom :InvitationList],
  [ a owl:Restriction;
   owl:onProperty rdfL:first; owl:allValuesFrom :Invited].
```

```
prefix : <foo:bla#>
select ?I
from <file:invitation-list.n3>
where {?I a :Invited}
```

[Filename: RDF/invitation-list.sparql]

[Filename: RDF/invitation-list.n3]

348

## 7.4 Nominals: The O in SHOIQ

### TBox vs. ABox

#### Description Logics Terminology

Clean separation between TBox and ABox vocabulary:

- TBox: RDFS/OWL vocabulary for information about classes and properties (further partitioned into definitions and axioms),
- ABox: Domain vocabulary and `rdf:type`.

#### RDF/RDF/OWL Ontologies

- Syntactically: allow to mix everything in a single set of triples.
- OWL-DL restriction: clean usage of individuals vs. classes
  - individuals only in application property triples (ABox)
  - classes only in context of RDFS/OWL built-ins (like `(X a :Person)` or `(:hasChild rdfs:range :Person)`, etc.) (TBox)

349

#### Recall: Reification

- Reification treats a class (e.g. `:Penguin`) or a property as an individual (`:Penguin a :Species`)
- reification assigns properties from an application domain to classes and properties.
- useful when talking about metadata notions,
- risk: allows for paradoxes.

### NOMINALS

- use individuals (that usually occur only in the ABox) in *specific positions* in the TBox:
- as individuals (that are often implemented in the reasoner as unary classes) with `[a owl:Restriction; owl:onProperty property; owl:hasValue object]` (the class of all things such that `{?x property object}` holds).
- in enumerated classes `class owl:oneOf (o1, . . . , on)` (*class* is defined to be the set `{o1, . . . , on}`).

350

## USING NOMINALS: ITALIAN CITIES

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix mon: <http://www.semwebtech.org/mondial/10/meta#>.
@prefix it: <foo://italian/>.
it:Italy owl:sameAs <http://www.semwebtech.org/mondial/10/countries/I/>.
it:ItalianCity a owl:Class; owl:intersectionOf
  (mon:City
   [a owl:Restriction; owl:onProperty mon:cityIn;
    owl:hasValue it:Italy]). # Nominal: an individual in a TBox axiom
```

[Filename: RDF/italiancities.n3]

```
prefix it: <foo://italian/>
select ?X ?Y
from <file:mondial-meta.n3>
from <file:mondial-europe.n3>
from <file:italiancities.n3>
where {?X a it:ItalianCity}
```

[Filename: RDF/italiancities.sparql]

- the query `{?X :cityIn <http://www.semwebtech.org/mondial/10/countries/I/>}` would be shorter, but here a class should be defined for further use ...

351

## AN ONTOLOGY IN OWL

Consider the Italian-English-Ontology from Slide 52.

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix f: <foo://bla/>.
f:Italian rdfs:subClassOf f:Person;
  owl:disjointWith f:English;
  owl:unionOf (f:Lazy f:Latin Lover).
f:Lazy owl:disjointWith f:Latin Lover.
f:English rdfs:subClassOf f:Person.
f:Gentleman rdfs:subClassOf f:English.
f:Hooligan rdfs:subClassOf f:English.
f:Latin Lover rdfs:subClassOf f:Gentleman.
```

Class tree with jena -e:

```
owl:Thing
  bla:Person
    bla:English
      bla:Hooligan
      bla:Gentleman
        bla:Italian = bla:Lazy
owl:Nothing = bla:Latin Lover
```

- Latin Lover is empty,  
thus Italian  $\equiv$  Lazy.

[Filename: RDF/italian-english.n3]

352

## Italians and Englishmen (Cont'd)

- the conclusions apply to the instance level:

```
@prefix : <foo://bla/>.
:mario a :Italian.
```

[Filename: RDF/mario.n3]

```
prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>
prefix : <foo://bla/>
select ?C
from <file:italian-english.n3>
from <file:mario.n3>
where { :mario rdf:type ?C }
```

[Filename: RDF/italian-english.sparql]

353

## AN ONTOLOGY IN OWL

Consider the Italian-Ontology from Slide 53.

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix it: <foo://italian/>.
it:Bolzano owl:sameAs
<http://www.semwebtech.org/mondial/10/countries/I/provinces/TrentinoAltoAdige/cities/Bolzano/>
it:Italian owl:intersectionOf
  (it:Person
    [a owl:Restriction; owl:onProperty it:livesIn;
      owl:someValuesFrom it:ItalianCity]);
  owl:unionOf (it:Lazy it:Mafioso it:LatinLover).
it:Professor rdfs:subClassOf it:Person.
it:Lazy owl:disjointWith it:ItalianProf;
  owl:disjointWith it:Mafioso;
  owl:disjointWith it:LatinLover.
it:Mafioso owl:disjointWith it:ItalianProf;
  owl:disjointWith it:LatinLover.
it:ItalianProf owl:intersectionOf (it:Italian it:Professor).
it:enrico a it:Professor; it:livesIn it:Bolzano.
```

```
prefix : <foo://italian/>
select ?C
from <file:italian-prof.n3>
from <file:mondial-meta.n3>
from <file:mondial-europe.n3>
from <file:italiancities.n3>
where { :enrico a ?C }
```

[Filename: RDF/italian-prof.sparql]

[Filename: RDF/italian-prof.n3]

354

## ENUMERATED CLASSES: ONEOF

```
@prefix rdf: <http://www.w3.org/1999/02/22-rdf-syntax-ns#>.
```

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
```

```
@prefix mon: <http://www.semwebtech.org/mondial/10/meta#>.
```

```
<bla:MontanunionMembers> owl:intersectionOf
```

```
  (mon:Country
```

```
    [owl:oneOf
```

```
      (<http://www.semwebtech.org/mondial/10/countries/NL/>
```

```
      <http://www.semwebtech.org/mondial/10/countries/B/>
```

```
      <http://www.semwebtech.org/mondial/10/countries/L/>
```

```
      <http://www.semwebtech.org/mondial/10/countries/F/>
```

```
      <http://www.semwebtech.org/mondial/10/countries/I/>
```

```
      <http://www.semwebtech.org/mondial/10/countries/D/>))].
```

```
<bla:Result> owl:intersectionOf (mon:Organization
```

```
  [a owl:Restriction; owl:onProperty mon:hasMember;
```

```
   owl:someValuesFrom <bla:MontanunionMembers>]).
```

```
[Filename: RDF/montanunion.n3]
```

```
select ?X
```

```
from <file:montanunion.n3>
```

```
from <file:mondial-europe.n3>
```

```
from <file:mondial-meta.n3>
```

```
where {?X a <bla:Result>}
```

```
[RDF/montanunion.sparql]
```

- Query: all organizations that **share** a member with the Montanunion.

355

### oneOf (Example Cont'd)

- previous example: “all organizations that share a member with the Montanunion.”  
(DL:  $x \in \exists \text{hasMember.MontanunionMembers}$ )
- “all organizations where *all* members are also members of the Montanunion.”  
(DL:  $x \in \forall \text{hasMember.MontanunionMembers}$ )
- The result is empty (although there is e.g. BeNeLux) due to open world: it is not known whether there may exist additional members of e.g. BeNeLux.
- **Only if the membership of Benelux is “closed”, results can be proven:**

```
@prefix owl: <http://www.w3.org/2002/07/owl#>.
```

```
@prefix mon: <http://www.semwebtech.org/mondial/10/meta#>.
```

```
<http://www.semwebtech.org/mondial/10/organizations/Benelux/>
```

```
  a [a owl:Restriction;
```

```
     owl:onProperty mon:hasMember; owl:cardinality 3].
```

```
<bla:SubsetOfMU> owl:intersectionOf (mon:Organization
```

```
  [a owl:Restriction; owl:onProperty mon:hasMember;
```

```
   owl:allValuesFrom <bla:MontanunionMembers>]).
```

```
mon:name a owl:FunctionalProperty. # not yet given in th
```

```
[Filename: RDF/montanunion2.n3]
```

```
select ?X
```

```
from <file:montanunion.n3>
```

```
from <file:montanunion2.n3>
```

```
from <file:mondial-europe.n3>
```

```
from <file:mondial-meta.n3>
```

```
where {?X a <bla:SubsetOfMU>}
```

```
[RDF/montanunion2.sparql]
```

356

## oneOf (Example Cont'd)

- “all organizations that cover *all* members of the Montanunion.”

```
@prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>.
@prefix owl: <http://www.w3.org/2002/07/owl#>.
@prefix mon: <http://www.semwebtech.org/mondial/10/meta#>.
<bla:EUMembers> owl:equivalentClass [a owl:Restriction;
    owl:onProperty mon:isMember; owl:hasValue
    <http://www.semwebtech.org/mondial/10/organizations/EU/>].
```

[Filename: RDF/montanunion3.n3]

```
prefix rdfs: <http://www.w3.org/2000/01/rdf-schema#>
select ?X # ?Y ?Z
from <file:montanunion.n3>
from <file:montanunion3.n3>
from <file:mondial-europe.n3>
from <file:mondial-meta.n3>
where {#{?Y a <bla:EUMembers>}} UNION {?Z a <bla:MontanunionMembers>} UNION
    {<bla:MontanunionMembers> rdfs:subClassOf ?X}} [RDF/montanunion3.sparql]
```

357

## ONEOF (EXAMPLE CONT'D)

Previous example:

- only for one organization
- defined a class that contains all members of the organization
- not possible to define a *family of classes* – one class for each organization.
- this would require a *parameterized constructor*:

“ $c_{org}$  is the set of all members of *org*”

Second-Order Logic: each organization can be seen as a unary predicate (=set):

$\forall Org : Org(c) \leftrightarrow \text{hasMember}(Org, c)$

or in F-Logic syntax:  $C \text{ isa } Org :- Org:organization [\text{hasMember} \rightarrow C]$

yields e.g.

$I(eu) = \{germany, france, \dots\}$ ,

$I(nato) = \{usa, canada, germany, \dots\}$

Recall that “organization” itself is a predicate:

$I(organization) = \{eu, nato, \dots\}$

So we have again reification: organizations are both first-order-individuals and classes.

358

## CONVENIENCE CONSTRUCT: OWL:ALLDIFFERENT

- owl:oneOf defines a class as a closed set;
- in owl:oneOf  $(x_1, \dots, x_n)$ , two items may be the same (open world),

### owl:AllDifferent

- Triples of the form `:a owl:differentFrom :b` state that two individuals are different.  
For a database with  $n$  elements, one needs  
 $(n - 1) + (n - 2) + \dots + 2 + 1 = \sum_{i=1..n} i = n \cdot (n + 1)/2 = O(n^2)$  such statements.
- The –purely syntactical– convenience construct  
`[ a owl:AllDifferent; owl:members (r1 r2 ... rn) ]`  
provides a shorthand notation.
  - it is *immediately* translated into the set of all statements  
 $\{r_i \text{ owl:differentFrom } r_j \mid i \neq j \in 1..n\}$
  - `[ a owl:AllDifferent; owl:members (...) ]`  
is to be understood as a (blank node) that acts as a *specification* that the listed things are different that does not actually exist in the model.
